THE TRINITY SYSTEM

ELIMINATE LOST PAGERS

The Trinity System was introduced in June 2000 to reduce the pager loss associated with guest paging. This patented technology allows the restaurant to call waiting guests on their own cell phones or pagers. If they don't have one, they can be given an on-premise pager such as Adver-Teaser™ or Coaster Call®. By combining these 3 technologies, the Trinity System can cut your initial costs as well as the monthly fees associated with guest paging (due to loss).

Here's How It Works:

- The host/hostess inquires if the guest has a cell phone or pager.
- If so, the phone number is programmed into the transmitter and the transmitter assigns it a "pager number."
- When the table is ready the host/hostess simply enters the assigned number to call the guest.
- For cell phones, the guest will hear a pre-recorded message that their table is ready.
- For pagers, it will enter a designated code that the table is ready.
- If the guest does not have a cell phone or pager, they can be given an on-site pager such as the Adver-Teaser or Coaster Call.

"Your table is ready at…"

"After using regular guest paging systems for years, we switched to the Trinity System by LRS and dramatically reduced the cost of our guest paging system. We have put the Trinity System in all our locations nationwide."

- Sherman Lyle
  Director - The Village Tavern

"Johnny Carino's is excited about the Trinity system and what it can do for our restaurants…We were initially attracted to the Trinity system because of the personal cell phone/pager feature,"

- David Prichard
  Opening Unit Director of Johnny Carino's.

Great For Restaurants in Malls or Tourist Areas!

Patented Technology!
